PROFESSIONAL PROFILE.

Systems Engineer specializing in Full-Stack Development and Automation, with the ability to adapt quickly to new technologies and fast-paced project changes. Backed by hands-on corporate experience in web development using languages such as Python, Java, PHP, and React, alongside cybersecurity operations. Focused on translating complex user requirements into scalable technical solutions that account for critical edge cases. I combine analytical problem-solving with the communication skills needed to work effectively alongside clients, stakeholders, and development teams.

TECHNICAL SKILLS

Backend & Automation

Python, Java, PHP, Django, REST APIs, Process Automation (Microsoft Power Automate)

Frontend & CMS

React, JavaScript, HTML5, CSS3, WordPress

Databases & Storage

SQL, MySQL, SQLite, Firebase Firestore

Cybersecurity & Networks

Endpoint Detection and Response (EDR), Symantec Endpoint Protection (SEP), Indicators of Compromise (IoC) Management, Access Management, Security Controls, OSI Model, TCP/IP

Tools & Platforms

Git, GitHub, Google Cloud Console, Android Studio

EXPERIENCE

Cybersecurity Intern – Banco de Bogotá

February 2026 – July 2026

- Management of access permissions via Remote Desktop and support in the management of cybersecurity controls, including the monitoring of indicators, findings and device assurance processes, streamlining device onboarding timelines and reducing manual setup friction for infrastructure deployment.
- Developed scripts to automate the deployment of Endpoint Detection and Response (EDR) solutions, optimising operational processes, and provided support in automating the blocking of Indicators of Compromise (IoCs) using tools such as EDR, Symantec Endpoint Protection (SEP) and Antimalware for Linux, successfully reducing incident containment latency and minimizing human error during threat response.
- Ensuring system hardening and eliminating unauthorized access paths across corporate environments.

Junior Web Developer – KOIA Studio S.A.S

March 2025 – November 2025

- Development and maintenance of web applications using PHP, WordPress, HTML, CSS and JavaScript, including the creation of custom plugins, administrative dashboards for e-commerce platforms and API integration.
- Involvement in the design and implementation of web solutions based on client-server architecture, contributing to the development of scalable applications and the maintenance of existing functionalities, expanding platform capabilities, boosting data processing efficiency, and improving client retention.
- Achieving architectural stability, handling complex edge cases, and ensuring zero-downtime migrations.

PROJECTS

Automation for Indicators of Compromise (IoC) Management
Python | Microsoft Power Automate | EDR | Symantec Endpoint Protection (SEP) | Antimalware for Linux

automation solution using Microsoft Power Automate and Python to manage the processing of Indicators of Compromise (IoC). The automation receives emails containing IoCs, extracts and classifies the information to automatically distribute it to the various security platforms, including EDR, Symantec Endpoint Protection (SEP) and Antimalware for Linux. It then validates the processed indicators, sends an email with the execution result and automatically notifies the administrators responsible for each tool, optimising the operational workflow and reducing manual tasks.

Paintball Camp Droid (Independent Project)
Python | PHP | React | SQL | Twilio | JavaScript | HTML | CSS | Git

I participated as a developer in the maintenance and development of a web platform for managing a paintball centre, carrying out requirements analysis, resolving issues, developing new features and implementing improvements requested by the client. The system enabled the optimisation of customer management, bookings, stock, games and payments through an integrated web solution. During the project, I developed features for both the front-end and back-end using React, PHP and Python; managed SQL databases; implemented integration with Twilio for sending automated messages and calls; carried out functional testing prior to each release; and provided ongoing maintenance for the application to ensure it functioned correctly.

Defensive Artificial Intelligence Agent for the Intelligent Prioritisation of Cybersecurity Alerts
Python | Django | Suricata | OSINT | Machine Learning | Random Forest

Design and development of a working prototype of an artificial intelligence agent aimed at automating the triage and prioritisation of cybersecurity alerts on LAN networks. The solution integrates events generated by Suricata, open-source intelligence (OSINT) data and a Random Forest model to classify threats according to their level of criticality and support the security analyst's decision-making, thereby reducing alert fatigue in SOC environments.

EDUCATION

Systems Engineering August 2021 – Present
Universidad Piloto de Colombia, Bogotá D.C. – Colombia
